## New & Updated Dialogs for DAX

### *Overview*

- DAX applications call standard Win32 APIs for which corresponding OS2 function(s) have been wrapped.
- Most of the DAX wrapper code for the common dialogs is in **src\ps\awe\dialog.cpp**
- Merlin & the Warp Fixpack have new/updated common dialogs for DAX:
  - File Open/Save           DAX interface added
  - Font                     DAX interface added
  - Print                    new dialog for printer selection
  - Find/Replace            new dialog for string search & replace
  - Color                    new dialog for color selection

All source files (except mri) are in **src\ps\controls\dialogs\**

MRI files are located in **mri\en\ps\controls\dialogs\**

- New flags and structures for DAX are found in **rel\os2c\include\base\os2\** under:
  - **pmctlsp.h**            (new common dialog flags/structures)
  - **os2ctlwx.h**          (new "public" DAX only flags added for other controls)

**Note:** Every control used by a DAX wrapper is subclassed. For dialogs containing several controls, this results in significant additional stack space consumption
